

Fix: trainee_id vs user_id Mapping Issue

Problem:

Backend me trainee_id ki jagah user_id store ho raha hai. Ye issue Hibernate mapping ke wajah se ho sakta hai.

Root Cause

Agar User entity ka primary key column database me 'user_id' hai, toh Hibernate by default usi column ko reference karega.

Correct Solution

TraineeDepartment entity me @JoinColumn ke andar referencedColumnName specify karna zaroori hai.

Correct Mapping Example:

```
@ManyToOne
@JoinColumn(
    name = "trainee_id",
    referencedColumnName = "userid", // actual column name in User
    table
    nullable = false
)
private User trainee;
```

Steps to Apply Fix

1. Application stop karo.
2. DB me existing foreign key drop karo.
3. Correct mapping add karo.
4. Application restart karo.
